It's Easy Being *Green* with JR's *Insul-Hold*

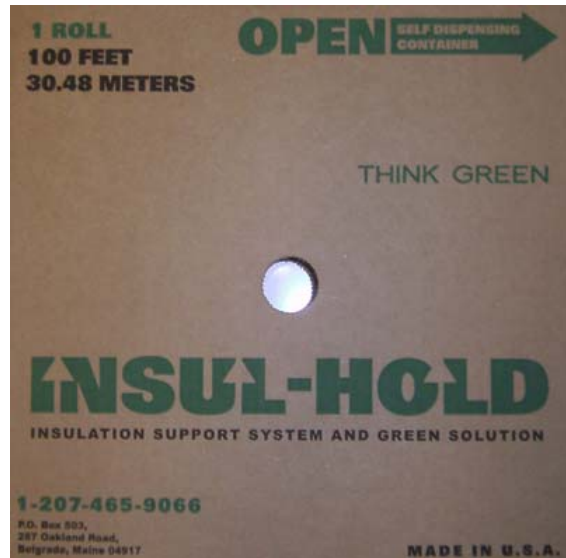

Insul-hold coils come in 100' Rolls

Insul-Hold is a support system for all types of rigid and fiberglass insulation products. Designed to anchor and hold most types of insulation in the correct position thereby preserving the R-value of the insulating product. *Whether used to prevent heat loss or promote efficient cooling, Insul-Hold* assures maximum effectiveness of any insulating product. *Insul-Hold* also doubles as horizontal bracing which prevents insulation from falling too deeply into the wall cavity. Suitable for use in wood frame, steel building, or masonry construction of interior or exterior walls, ceilings and crawl spaces and in basements, it provides support even where sheathing is not required. *Insul-Hold* is ideal for use in retrofitting buildings as well as new construction to *Green and LEED standards. Easy to use Insul-Hold saves time, energy and money.*

Nothing Holds Like *Insul-Hold*

When used as specified*, *Insul-Hold* is cost effective as it dramatically reduces the time it takes to install insulation as compared to the conventional method. *Insul-Hold* eliminates the frustrations of sagging and falling insulation and avoids costly, insulation related call backs. When *Insul-Hold* is used, insulation immediately hangs correctly and stays in place.

Product Description

Fabricated with 20 gauge galvanized steel and packaged in 100 foot rolls weighing approximately 13 lbs, *Insul-Hold never rusts*. As a time savings convenience, the 100 foot rolls are delivered in self-dispensing boxes, no larger than a pizza box for *ease of handling and storage. Insul-Hold* is pulled out of the box as needed; there is *no need to pre-cut and measure*, no struggling with entangled lengths, installation is quick and easy. The rolls are pre-punched every 8 inches with a uniquely designed arrow for quick and easy fastening to stud layout. The pre-punched arrows remain flat until they are folded out, just prior to hanging insulation. *Insul-Hold lies flat, making it easy to cut with tin snips and especially safe to use.* Additionally, the 3" arrow lengths may be varied by bending at different points on the arrow, making them ideal for use with various insulation densities and thicknesses. The unique arrow design allows insulation to be slipped easily onto the arrows, but prevents it from slipping off. When used properly*, the unique arrow penetrates without protruding through the insulation *preventing thermal short-circuiting*, and it does not break through the vapor barrier preserving the *R-value. Insul-Hold* can be used on virtually any surface.
